What We'll Talk About

• What it means for a logic to be "substructural"

< 47 ▶

- What it means for a logic to be "substructural"
- A case study of a particular substructural logic (linear logic)

- What it means for a logic to be "substructural"
- A case study of a particular substructural logic (linear logic)
- How to make malloc and free safe

- What it means for a logic to be "substructural"
- A case study of a particular substructural logic (linear logic)
- How to make malloc and free safe
- What it looks like to code in a language with resource-aware types

Substructural Logic

	for 🛛	

æ

イロト イヨト イヨト イヨト

The constructive logic we have been working with so far has the following admissible rules, which we call "structural properties" of the logic:

$$\frac{\Gamma \vdash C}{\Gamma, A \vdash C} (WEAK) \qquad \qquad \frac{\Gamma, A, A \vdash C}{\Gamma, A \vdash C} (CNTR)$$
$$\frac{\Gamma, A, B \vdash C}{\Gamma, B, A \vdash C} (EXCH)$$

What happens if you remove some of these structural properties?

< 🗗 🕨

What happens if you remove some of these structural properties? You would get a new logical system!

What happens if you remove some of these structural properties? You would get a new logical system!

• Affine Logic: no contraction

What happens if you remove some of these structural properties? You would get a new logical system!

- Affine Logic: no contraction
- Linear Logic: no weakening or contraction

What happens if you remove some of these structural properties? You would get a new logical system!

- Affine Logic: no contraction
- Linear Logic: no weakening or contraction
- Ordered Logic: no weakening, contraction, or exchange

What happens if you remove some of these structural properties? You would get a new logical system!

- Affine Logic: no contraction
- Linear Logic: no weakening or contraction
- Ordered Logic: no weakening, contraction, or exchange

Question

What are the consequences of not having these structural properties?

What happens if you remove some of these structural properties? You would get a new logical system!

- Affine Logic: no contraction
- Linear Logic: no weakening or contraction
- Ordered Logic: no weakening, contraction, or exchange

Question

What are the consequences of not having these structural properties?

Today, we'll be focusing on *linear logic*, and how we can use it to implement a memory-safe version of C0.

Linear Logic

	Type	

2

< ロ > < 回 > < 回 > < 回 > < 回 >

The moon is made of green cheese. Therefore, you come to hype for types today.

Question Is this logical?

・ 同 ト ・ ヨ ト ・ ヨ ト

Different Interpretation of Implication

Constructive logic interprets $A \Rightarrow B$ as "If you give me A is true, then I give you B is true". But what it really says is "If you give me as many copy of A as I need, then I give you B is true".

Different Interpretation of Implication

Constructive logic interprets $A \Rightarrow B$ as "If you give me A is true, then I give you B is true". But what it really says is "If you give me as many copy of A as I need, then I give you B is true".

Idea

The problem of previous example is that to prove the conclusion we only need zero copies of the assumption, hence lacking "relevance".

Different Interpretation of Implication

Constructive logic interprets $A \Rightarrow B$ as "If you give me A is true, then I give you B is true". But what it really says is "If you give me as many copy of A as I need, then I give you B is true".

Idea

The problem of previous example is that to prove the conclusion we only need zero copies of the assumption, hence lacking "relevance".

Idea

We need a logic that forces relevance.

- 4 回 ト 4 ヨ ト 4 ヨ ト

Malloc is Scary...

Consider the following C code:

```
1 int main () {
2     char *str;
3     str = (char *) malloc(13);
4     strcpy(str, "hypefortypes");
5     free(str);
6     return(0);
7 }
```

In C, we have to make sure we allocate and deallocate every memory cell exactly once.

The Problem With Constructive Logic

In "normal" constructive logic, we have no concept of state.

Hy		

э

The Problem With Constructive Logic

In "normal" constructive logic, we have no concept of state.

Big Idea

Proofs should no longer be *persistent*, but rather *ephemeral*.

be fo	

The Problem With Constructive Logic

In "normal" constructive logic, we have no concept of state.

Big Idea

Proofs should no longer be *persistent*, but rather *ephemeral*.

Persistence is due to implicit **structural rules**: weakening and contraction.

Weakening

```
1 int main() {
2 int *x = (int *) malloc(sizeof(int));
3 *x = 3;
4 return 0;
5 }
```

	Types

3

イロト イヨト イヨト

Weakening

```
1 int main() {
2 int *x = (int *) malloc(sizeof(int));
3 *x = 3;
4 return 0;
5 }
```

Weakening: we can "drop" assumptions

$$\frac{\Gamma \vdash e : \tau}{\Gamma, x : \tau' \vdash e : \tau}$$
(WEAK)

3

イロト 不得 トイヨト イヨト

Contraction

```
1 void f(int *x) {
    free(x);
2
3 }
4
5
 int main() {
    int *x = (int *) malloc(sizeof(int));
6
   *x = 3;
7
   f(x);
8
    f(x);
9
    return 0;
10
11 }
```

3

イロト イボト イヨト イヨト

Contraction

```
1 void f(int *x) {
    free(x);
2
3 }
4
 int main() {
5
    int *x = (int *) malloc(sizeof(int));
6
    *x = 3;
7
   f(x);
8
   f(x);
9
   return 0;
10
11 }
```

Contraction: we can "duplicate" assumptions

$$\frac{\Gamma, x_1: \tau, x_2: \tau \vdash e: \tau'}{\Gamma, x: \tau \vdash [x, x/x_1, x_2]e: \tau'}$$
(CNTR)

3

Introduction to Linear Logic

In linear logic, we have neither weakening nor contraction.

- Requirement that we use each piece of data *exactly* once no duplication, no dropping
- Comes with an inherent idea of "resources" that are used up
- Allows us to write safe, stateful (imperative!) programs

```
1 int* foo(int* a, int* b) {
   free(a); return b;
2
3 }
4
 int main() {
5
   int* x = alloc(int);
6
   int* y = foo(x, x); // now a type error!
7
   free(y);
8
9
   return 0;
10 }
```

In general, pointer equality won't make sense in our language, since all pointers should be distinct.

However, in C, we need a way to check if pointers are NULL! Introducing:

```
1 int* create() /* ... */
2
 int main() {
3
   int* x = create();
4
5
    if (x is NULL) {
6
    return 0;
7
   } else {
8
      int y = *x; // still have x here!
9
      return y;
10
   }
11
12 }
```

$$\overline{\Gamma; \mathbf{?} \vdash \mathsf{NULL} : \tau^*}$$

Resource Tracking: Struct Introduction

Just like standard C0, we can allocate structs:

```
1 struct list {
  int head;
2
   struct list* tail;
3
4 };
5
6 struct list* nil() {
   return NULL;
7
8 }
9
10 struct list* cons(int x, struct list* xs) {
   struct list* node = alloc(struct list);
11
12
 node - > head = x;
node->tail = xs;
   return node;
14
15 }
```

Resource Tracking: Struct Elimination

Problem

We can't eliminate structs like we used to. How will we know that each field is used exactly once?

Resource Tracking: Struct Elimination

Problem

We can't eliminate structs like we used to. How will we know that each field is used exactly once?

Structs are just like products - so, pattern match!

Resource Tracking: Struct Elimination

Problem

We can't eliminate structs like we used to. How will we know that each field is used exactly once?

Structs are just like products - so, pattern match!

```
1 struct list {
   int head;
2
   struct list* tail;
3
4
 };
5
 int list_sum(struct list* 1) {
6
    if (1 is NULL)
7
     return 0;
8
9
   let { head = x; tail = xs; } = 1; // new syntax
10
    return x + list_sum(xs);
11
12 }
```
