#### Main Idea

A *compiler* is simply a translator from one programming language to another

- 4 回 ト 4 三 ト 4 三 ト

Rather than going straight to Assembly, we'll want to use intermediate languages, composing smaller compiler phases

э

Move local functions to top level. But what to do with local variables?

```
let outer (x : int) =
  let inner (y : int) = x + y in
  inner
```

Multiple approaches!

# Middle End - Hoisting

```
let outer (x : int) : int -> int =
  let inner (y : int) = x + y
  inner
```

Straightforward solution: Partial Application + Lambda Lifting

Turn local variables into function variables

Introduce "partial application" structure for functions

let inner (x : int) (y : int) = x + y

let outer (x : int) = pApp (inner, x)

7/22

# Middle End - Hoisting

```
let outer (x : int) : int \rightarrow int =
  let inner (y : int) = x + y
  inner
```

Straightforward solution: Partial Application + Lambda Lifting

1 Turn local variables into function variables Introduce "partial application" structure for functions

let inner (x : int) (y : int) = x + y

let outer (x : int) = pApp (inner, x)

pApp (pApp (inner, 5), 6)==>\* inner 5 6

7/22

# Middle End - Memory Allocation

- OPS Conversion
- Hoisting
- **6** Memory Allocation

Create memory representations of program values:

- Primitives (ex. int)
- Functions (are values!)
- Datatypes

# Memory Allocation - Background

Stack: primitives, small program values

**Heap:** larger, more complicated values (ex. non-constant constructors, closures, records)

When we store something on the heap, the memory often looks something like this:

header	payload
--------	---------

#### Problem

#### Problem

How are ADTs in OCaml with arguments represented in memory?

type t = Apple | Orange of int | Pear of string | Kiwi

	for	

э

(日)

#### Problem

How are ADTs in OCaml with arguments represented in memory?

type t = Apple | Orange of int | Pear of string | Kiwi

The arguments could be large, so let's allocate these on the heap:

size of block	tag	payload
header		

The non-parameterized constructors will remain integers, while the parameterized constructors will be pointers to memory on the heap.

Hype for Types	Compilation	C	October 7	, 2024		11/22
			1 E 1	1 = 1	-	*) 4 (*

Sidenote: in OCaml the numbering for parameterized constructors is separate from non-parameterized constructors:

э

イロト 不得 トイヨト イヨト

type list = Nil | Cons of int \* list let mylist = Cons (1, Cons (2, Cons (3, Nil)))

#### Question

How would mylist be represented in memory?

A linked-list!

	Types

э

type list = Nil | Cons of int \* list let mylist = Cons (1, Cons (2, Cons (3, Nil)))

#### Question

How would mylist be represented in memory?

A linked-list! Although this may be inefficient, so we can "unroll" to put multiple elements at one node in the linked-list.

(1) マン・ション (1) マン・ション (1)

type list = Nil | Cons of int \* list let mylist = Cons (1, Cons (2, Cons (3, Nil)))

#### Question

How would mylist be represented in memory?

A linked-list! Although this may be inefficient, so we can "unroll" to put multiple elements at one node in the linked-list.

At a high level it looks something like this:

```
type list =
   Nil
   One of int
   Two of int * int
   Rest of int * int * int * list
```

# Why CPS?

CPS conversion rewrites functions to ensure every function call is a tail call

#### Main Idea

CPS makes control flow explicit - everything is represented as a jump to the next continuation.

Bonus: Save stack space! Every function is tail-recursive, so no "stack overflow". (There's no "stack"!)

```

## Conclusion

	for	

3

イロト イヨト イヨト イヨト

# Summary

- Compilers are "language translators", and often compositions of smaller "language translators".
- Types guide our thinking when we implement the translations!
  - Each language is "real", complete with types and an evaluation strategy for all well-typed programs.
  - Bonus: we can do optimization at any point without worrying about special "invariants" !
  - Easier to debug, too. If output code doesn't typecheck, it's a bug.
- By thinking compositionally, we slowly transform high-level code into assembly.

(日)

Writing a compiler is very hard, but rewarding (because compilers are useful, unlike PL theory). If this lecture seems cool, consider taking 15-411 - Compiler Design. Also take 15-417 - HOT Compilation!<sup>2</sup>

<sup>2</sup>Frank is teaching it next semester! Yippee!
