What's the length of the left spine in the output?

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

What's the length of the left spine in the output?

- ≥ 6 in the first four cases
- 4 in the fifth case
- ≥ 6 in the sixth case (f is non-empty)
- 5 in the seventh case
- \leq 3 in the last case

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Another note:

In the first four cases, at least one node on the left spine must have a right child, but in the sixth case, that isn't true.

• foo is injective!

Also, foo is surjective.

Also, foo is surjective. (prove it for yourself, very long and not very interesting)

• foo is injective bijective!

So what?

${\tt tree}^7 {\ } {\tt \ tree}^?$

foo isn't recursive!

$tree^7 \simeq tree$ in constant time!

$$T = \frac{1 \pm \sqrt{-3}}{2}?$$

This does give $T^7 = T$...

▲□▶▲圖▶▲≣▶▲≣▶ ≣ のQ@

Does this mean that $T^6 = 1$?

(ロ)、(型)、(E)、(E)、 E) の(()

$\texttt{tree}^6 \backsimeq \texttt{unit}$ is obviously false, but it follows from $\mathit{T} = \frac{1 \pm \sqrt{-3}}{2}$

The type equation $T^2 - T + 1 = 0$ is not well-formed, because subtraction isn't defined on types!

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- The only meaningful operations on types are $+, \times$ (and exponentiation)
- For any type equation/isomorphism *A* = *B*, there is a pattern-matching-only bijection from *A* to *B*
