# Detypify

Consider these well typed expressions:

sprintf "nice"
sprintf "%d" 5
sprintf "%s,%d" "wow" 32

What is the type of sprintf?

3

# Detypify

Consider these well typed expressions:

sprintf "nice"
sprintf "%d" 5
sprintf "%s,%d" "wow" 32

What is the type of sprintf? Well... it depends.

3

The type of sprintf *depends* on the value of the argument. In order to compute the type of sprintf, we'll need to write a function that takes a string (List char), and returns a *type*!

The type of sprintf *depends* on the value of the argument. In order to compute the type of sprintf, we'll need to write a function that takes a string (List char), and returns a *type*!

```
(* sprintf s : formatType s *)
```

(日)

The type of sprintf *depends* on the value of the argument. In order to compute the type of sprintf, we'll need to write a function that takes a string (List char), and returns a *type*!

```
(* sprintf s : formatType s *)
fun formatType (s : char list) : type =
 case s of
                      => char list
    []
  | ('%' :: 'd' :: cs) => (int -> formatType cs)
  | ('%' :: 's' :: cs) => (string -> formatType cs)
  | (_ :: cs) => formatType cs
```

The type of sprintf *depends* on the value of the argument. In order to compute the type of sprintf, we'll need to write a function that takes a string (List char), and returns a *type*!

```
(* sprintf s : formatType s *)
fun formatType (s : char list) : type =
 case s of
                      => char list
    []
  | ('%' :: 'd' :: cs) => (int -> formatType cs)
  | ('%' :: 's' :: cs) => (string -> formatType cs)
  | (_ :: cs) => formatType cs
(* formatType "%d and %s" = int -> string -> char list *)
(* sprintf "%d and %s" : int -> string -> char list *)
```

Ok, we can express the type of sprintf s for some argument s, but what's the type of sprintf?

< 4<sup>™</sup> >

Ok, we can express the type of sprintf s for some argument s, but what's the type of sprintf?

Recall that when we wanted to express a type like "A  $\rightarrow$  A for all A", we introduced universal quantification over *types*:  $\forall$  A.A  $\rightarrow$  A.

Ok, we can express the type of sprintf s for some argument s, but what's the type of sprintf?

Recall that when we wanted to express a type like "A  $\rightarrow$  A for all A", we introduced universal quantification over *types*:  $\forall$  A.A  $\rightarrow$  A.

What if we had universal quantification over values?

Ok, we can express the type of sprintf s for some argument s, but what's the type of sprintf?

Recall that when we wanted to express a type like "A  $\rightarrow$  A for all A", we introduced universal quantification over *types*:  $\forall$  A.A  $\rightarrow$  A.

In SML we write type contructors on the *right*:

```
val cool : int list = [1,2,3,4]
```

<sup>1</sup>Readers may note the parallels to another CS course mantra  $\mathbb{B} \to \mathbb{A} \cong \mathbb{A} \oplus \mathbb{A} \cong \mathbb{A} \oplus \mathbb{A}$ 

In SML we write type contructors on the *right*:

```
val cool : int list = [1,2,3,4]
```

But now we have functions in our types, and we apply functions on the left! So let's just write everything on the left. While we are at it, lets make values of type  $T_{ype}$  capital, and their values lowercase:

val cool : List Int = [1,2,3,4]
val a : A = (\* omitted \*)

In SML we write type contructors on the *right*:

```
val cool : int list = [1,2,3,4]
```

But now we have functions in our types, and we apply functions on the left! So let's just write everything on the left. While we are at it, lets make values of type Type capital, and their values lowercase:

```
val cool : List Int = [1,2,3,4]
val a : A = (* omitted *)
```

#### Question

What is the type of List?

<sup>1</sup>Readers may note the parallels to another CS course mantra  $\mathbb{B} \to \mathbb{A} \cong \mathbb{A} \oplus \mathbb{A} \cong \mathbb{A} \oplus \mathbb{A}$ 

In SML we write type contructors on the right:

               Vec A n \rightarrow
               Vec A ?? (* What should go here? *)
```

### **Existential Crisis**

For filter, we need to return the vector's length, *in addition* to the vector itself:

- 20

## **Existential Crisis**

For filter, we need to return the vector's length, *in addition* to the vector itself:

We want to refer to the left value of a tuple, in the TYPE on the right.

Intuition: existential quantification!

There exists some n : Nat, such that we return Vec A n.

(We're constructivists, so exists means I actually give you the value)

13/23

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ののの

## Duality

$$(x:\tau) \times A \equiv \exists x:\tau.A$$

This type can also be written:

```
As before, A \times B \equiv (\_:A) \times B
val filter : (A : Type) -> (n : Nat) ->
(A -> bool) ->
Vec A n ->
(m : Nat) × Vec A m
```

# Specifications are actually pretty nice

#### Discussion

Do you actually read function contracts/specifications in 122/150?

```
(* REQUIRES : input sequence is sorted *)
val search : int -> int seq -> int option
> search 3 [5,4,3] ==> NONE
(* "search is broken!" *)
(* piazza post ensues *)
```

A (10) A (10)

# **Compile-time Contracts**

The 122 solution:

```
int search (int target, int[] arr)
//@requires is_sorted(arr)
{
    . . .
}
```

Nice, but only works at runtime.

< 1 k

э

## Compile-time Contracts

The 122 solution:

```
int search (int target, int[] arr)
//@requires is_sorted(arr)
{
    ...
}
```

Nice, but only works at runtime.

What if passing search a non-sorted list was a type error?

(\* REQUIRES : second argument is greater than zero \*) val div : Nat -> Nat -> Nat

Comment contracts aren't good enough. I don't read comments!

3

(\* REQUIRES : second argument is greater than zero \*) val div : Nat -> Nat -> Nat

Comment contracts aren't good enough. I don't read comments!

val div : Nat -> Nat -> Option Nat

Incurs runtime cost to check for zero, and you still have to fail if it happens.
