# Detypify

Consider these well typed expressions:

sprintf "nice"
sprintf "%d" 5
sprintf "%s,%d" "wow" 32

What is the type of sprintf?

3

# Detypify

Consider these well typed expressions:

sprintf "nice"
sprintf "%d" 5
sprintf "%s,%d" "wow" 32

What is the type of sprintf? Well... it depends.

3

The type of sprintf *depends* on the value of the argument. In order to compute the type of sprintf, we'll need to write a function that takes a string (List char), and returns a *type*!

The type of sprintf *depends* on the value of the argument. In order to compute the type of sprintf, we'll need to write a function that takes a string (List char), and returns a *type*!

```
(* sprintf s : formatType s *)
```

The type of sprintf *depends* on the value of the argument. In order to compute the type of sprintf, we'll need to write a function that takes a string (List char), and returns a type!

```
(* sprintf s : formatType s *)
fun formatType (s : char list) : type =
 case s of
                      => char list
    []
  | ('%' :: 'd' :: cs) => (int -> formatType cs)
  | ('%' :: 's' :: cs) => (string -> formatType cs)
  | ( :: cs) => formatType cs
```

The type of sprintf *depends* on the value of the argument. In order to compute the type of sprintf, we'll need to write a function that takes a string (List char), and returns a *type*!

```
(* sprintf s : formatType s *)
fun formatType (s : char list) : type =
  case s of
                       => char list
    []
  | ('\%' :: 'd' :: cs) \Rightarrow (int \rightarrow formatType cs)
  | ('%' :: 's' :: cs) => (string -> formatType cs)
  | ( :: cs) => formatType cs
(* formatType "%d and %s" = int -> string -> char list *)
(* sprintf "%d and %s" : int -> string -> char list *)
```

Ok, we can express the type of sprintf s for some argument s, but what's the type of sprintf?

< 4 → <

Ok, we can express the type of sprintf s for some argument s, but what's the type of sprintf?

Recall that when we wanted to express a type like "A  $\rightarrow$  A for all A", we introduced universal quantification over *types*:  $\forall$  A.A  $\rightarrow$  A.

Ok, we can express the type of sprintf s for some argument s, but what's the type of sprintf?

Recall that when we wanted to express a type like "A  $\rightarrow$  A for all A", we introduced universal quantification over *types*:  $\forall$  A.A  $\rightarrow$  A.

What if we had universal quantification over values?

Ok, we can express the type of sprintf s for some argument s, but what's the type of sprintf?

Recall that when we wanted to express a type like "A  $\rightarrow$  A for all A", we introduced universal quantification over *types*:  $\forall$  A.A  $\rightarrow$  A.

What if we had universal quantification over values?

```
sprintf : (s : char list) -> formatType s
```

What kind of proposition does quantification over values correspond to?

What kind of proposition does quantification over values correspond to?

$$(x:\tau) \rightarrow A \equiv \forall x:\tau.A$$

What kind of proposition does quantification over values correspond to?

$$(x:\tau) \rightarrow A \equiv \forall x:\tau.A$$

This type is sometimes also written as:

$$(x:\tau) \to A$$

- **②** ∀*x* : *t*.*A*
- Π<sub>x:τ</sub> A

< (17) × <

What kind of proposition does quantification over values correspond to?

$$(x:\tau) \rightarrow A \equiv \forall x:\tau.A$$

This type is sometimes also written as:

- $(x:\tau) \to A$
- ② ∀x : t.A

#### Question

Seems like we now have two arrow types:

- Normal:  $A \rightarrow B$
- 2 Dependent:  $(x : A) \rightarrow B$

Do we need both?

イロト イヨト イヨト ・

#### Question

Seems like we now have two arrow types:

- $I Normal: A \to B$
- 2 Dependent:  $(x : A) \rightarrow B$

Do we need both?

・ロン ・四 と ・ ヨ と ・

#### Question

Seems like we now have two arrow types:

- $I Normal: A \to B$
- 2 Dependent:  $(x : A) \rightarrow B$

Do we need both? Nope!

$$A \to B \equiv (\_: A) \to B$$

э

#### Some Rules

$$\frac{\Gamma, x: \tau \vdash e: A \quad \Gamma, x: \tau \vdash A: Type}{\Gamma \vdash \lambda(x:\tau)e: (x:\tau) \to A} \qquad \frac{\Gamma \vdash e_1: (x:\tau) \to A \quad \Gamma \vdash e_2: \tau}{\Gamma \vdash e_1 : e_2: [e_2/x]A}$$

3

イロト イヨト イヨト イヨト

In SML we write type contructors on the *right*:

```
val cool : int list = [1,2,3,4]
```

In SML we write type contructors on the right:

```
val cool : int list = [1,2,3,4]
```

But now we have functions in our types, and we apply functions on the left! So let's just write everything on the left. While we are at it, lets make values of type  $T_{ype}$  capital, and their values lowercase:

val cool : List Int = [1,2,3,4]
val a : A = (\* omitted \*)

In SML we write type contructors on the right:

```
val cool : int list = [1,2,3,4]
```

But now we have functions in our types, and we apply functions on the left! So let's just write everything on the left. While we are at it, lets make values of type Type capital, and their values lowercase:

```
val cool : List Int = [1,2,3,4]
val a : A = (* omitted *)
```

#### Question

What is the type of List?

In SML we write type contructors on the *right*:

```
val cool : int list = [1,2,3,4]
```

But now we have functions in our types, and we apply functions on the left! So let's just write everything on the left. While we are at it, lets make values of type Type capital, and their values lowercase:

```
val cool : List Int = [1,2,3,4]
val a : A = (* omitted *)
```

#### Question

What is the type of List?

```
List : Type -> Type
```

List is a function over types!

#### Types are values<sup>1</sup>

## Vectors Again

If we can write functions from values to types, can we define new type constructors which depend on *values*?

10/26

(人間) トイヨト イヨト 三日

#### Vectors Again

```
inductive Vec : Type → Nat → Type
| nil : (A : Type) \rightarrow Vec A 0
| cons : (A : Type) \rightarrow (n : Nat) \rightarrow
              A \rightarrow Vec A n \rightarrow Vec A (n+1)
def two := 1 + 0 + 1
def xs : Vec String (6 / two) :=
  cons String two "hype" (
    cons String 1 (toString 4) (
       cons String 0 "types" (nil String)
    )
```

11/26

(日) (周) (三) (三) (三) (○) (○)

#### Vectors are actually usable now!

```
val append : (a : Type) -> (n m : Nat) ->
             Vec a n ->
             Vec a m ->
             Vec a (n + m)
val repeat : (a : Type) -> (n : Nat) ->
             a ->
             Vec a n
val filter : (a : Type) -> (n : Nat) ->
             (a -> bool) ->
             Vec a n ->
             Vec a ?? (* What should go here? *)
```

12/26

#### Vectors are actually usable now!

```
val append : (a : Type) -> (n m : Nat) ->
              Vec a n ->
              Vec a m ->
              Vec a (n + m)
val repeat : (a : Type) -> (n : Nat) ->
              a ->
              Vec a n
val filter : (a : Type) -> (n : Nat) ->
              (a \rightarrow bool) \rightarrow
              Vec a n ->
              Vec a ?? (* What should go here? *)
```

#### **Existential Crisis**

For filter, we need to return the vector's length, *in addition* to the vector itself:

3

## **Existential Crisis**

For filter, we need to return the vector's length, in addition to the vector itself:

```
val filter : (a : Type) \rightarrow (n : Nat) \rightarrow
                 (a -> bool) ->
                 Vec a n ->
                 Nat \times Vec a ??
```

We want to refer to the left value of a tuple, in the TYPE on the right.

Intuition: existential guantification!

There exists some n : Nat, such that we return Vec a n.

(We're constructivists, so exists means I actually give you the value)

## Duality

$$(x:\tau) \times A \equiv \exists x:\tau.A$$

This type can also be written:

```
As before, A \times B \equiv (\_:A) \times B
val filter : (a : Type) -> (n : Nat) ->
(a -> bool) ->
Vec a n ->
(m : Nat) × Vec a m
```

э

14/26

#### More Rules

$$\frac{\Gamma \vdash e_1 : \tau \quad \Gamma \vdash e_2 : [e_1/x]A \quad \Gamma, x : \tau \vdash A : Type}{\Gamma \vdash (e_1, e_2) : (x : \tau) \times A}$$
$$\frac{\Gamma \vdash e : (x : \tau) \times A}{\Gamma \vdash \pi_1 \; e : \tau} \qquad \frac{\Gamma \vdash e : (x : \tau) \times A}{\Gamma \vdash \pi_2 \; e : [\pi_1 \; e/x]A}$$

# Specifications are actually pretty nice

#### Discussion

Do you actually read function contracts/specifications in 122/150?

```
(* REQUIRES : input list is sorted *)
val search : int -> int list -> int option
> search 3 [5,4,3] ==> NONE
(* "search is broken!" *)
(* piazza post ensues *)
```

A (10) A (10)

## **Compile-time Contracts**

The 122 solution:

```
int search (int target, int[] arr)
//@requires is_sorted(arr)
{
    . . .
}
```

Nice, but only works at runtime.

< A >

э

# Compile-time Contracts

The 122 solution:

```
int search (int target, int[] arr)
//@requires is_sorted(arr)
{
    ...
}
```

Nice, but only works at runtime.

What if passing search a non-sorted list was a type error?

< A IN

(\* REQUIRES : second argument is greater than zero \*) val div : Nat -> Nat -> Nat

Comment contracts aren't good enough. I don't read comments!

э

(\* REQUIRES : second argument is greater than zero \*) val div : Nat -> Nat -> Nat

Comment contracts aren't good enough. I don't read comments!

val div : Nat -> Nat -> Nat option

Incurs runtime cost to check for zero, and you still have to fail if it happens.

(\* REQUIRES : second argument is greater than zero \*) val div : Nat -> Nat -> Nat

Comment contracts aren't good enough. I don't read comments!

val div : Nat -> Nat -> Nat option

Incurs runtime cost to check for zero, and you still have to fail if it happens.

val div : Nat -> (n : Nat) imes (1  $\leq$  n) -> Nat

Dividing by zero is impossible! And we incur no runtime cost to prevent it.

(\* REQUIRES : second argument is greater than zero \*) val div : Nat -> Nat -> Nat

Comment contracts aren't good enough. I don't read comments!

val div : Nat -> Nat -> Nat option

Incurs runtime cost to check for zero, and you still have to fail if it happens.

val div : Nat -> (n : Nat) imes (1  $\leq$  n) -> Nat

Dividing by zero is impossible! And we incur no runtime cost to prevent it. What does a value of type  $(n : Nat) \times (1 \le n)$  look like?

 $(3, \text{conceptsHW1.pdf}) : (n : Nat) \times (1 \le n)$ 

# Question: What goes in the PDF?

## 15-151 Refresher

What constitutes a proof of  $n \leq m$ ?

```

A kind of balanced binary tree of the following invariants:

- Every node is either red or black;
- Every red node must have two black children;
- Every leaf is black;
- The number of black nodes from the root to every leaf is the same.

#### **Red-black Trees**

```
The best you can do in SML is:

datatype Color = Red | Black

datatype 'a Tree =

Empty

| Node of Color * 'a * 'a Tree * 'a Tree
```

3

#### **Red-black Trees**

```
The best you can do in SML is:

datatype Color = Red | Black

datatype 'a Tree =

Empty

| Node of Color * 'a * 'a Tree * 'a Tree
```

But there is nothing that stop me from building a bad tree:

```
Node (Red, 1, Node (Red, 2, Leaf, Leaf), Empty)
```

3

Dependent Type to Rescue: Red-black Trees

```
inductive Color
| black
l red
inductive RBT : Type → Color → Nat → Type
| leaf : (A : Type) \rightarrow RBT A black 0
| red : (A : Type) \rightarrow (n : Nat) \rightarrow
           RBT A black n \rightarrow A \rightarrow RBT A black n \rightarrow RBT A red n
| black : (A : Type) \rightarrow (n : Nat) \rightarrow (y1 y2 : Color) \rightarrow
           RBT A y1 n \rightarrow A \rightarrow RBT A y2 n \rightarrow RBT A black (n+1)
```

24 / 26

## Some Sort of Contract

```
inductive Sorted : List Nat → Prop
| nil_sorted : Sorted []
 single_sorted : (n : Nat) → Sorted [n]
 cons_sorted : (n m : Nat) \rightarrow
                      (xs : List Nat) →
                      Le n m →
                      Sorted (m :: xs) \rightarrow
                      Sorted (n :: m :: xs)
def search : Nat
            \rightarrow (xs : List Nat)
            → Sorted xs
```

→ Option Nat := sorry
